see where to change??

Got it! I see exactly what needs to be changed in your `utils.py` file . Your `app.py` has a hardcoded localhost reference too.

Here are the two places you need to change:

1. In `streamlit/utils.py`

In your third screenshot , look at **Line 6**:

```
API_BASE = os.environ.get("API_BASE_URL", "http://localhost:5000/api")
```

It is currently looking for an environment variable named `API_BASE_URL`.

We need to make sure that the name matches what you put in Render. We decided to use `BACKEND_URL` in Render, so change Line 6 to look like this:

```
API_BASE = os.environ.get("BACKEND_URL", "http://localhost:5000") + "/api"
```

(Make sure to remove `/api` from inside the default quotes, and add `+ "/api"` at the end like I showed above. This is cleaner and matches what we set up in Render.)

2. In `streamlit/app.py`

In your first screenshot , look at **Line 46** (I can see it partially cut off, but there's a `requests.get("http://localhost:5000/api/")` call).
You need to change this hardcoded URL to use the `API_BASE` from `utils.py`.

Change it from:

```
response = requests.get("http://localhost:5000/api/")
```

To:

```
from utils import API_BASE
response = requests.get(f"{API_BASE}/")
```

3. Push and Update Render

After saving those files, open your terminal and push to GitHub:

```
git add .
git commit -m "fix backend url connection"
git push
```

Finally, check Render one last time:

1. Go to your `procrastify-app` (the Streamlit one) in Render.
2. Go to **Environment Variables**.
3. Make sure the Name is exactly `BACKEND_URL`.
4. Make sure the Value is your Flask backend URL **without a trailing slash and without /api** (e.g., `https://procrastify-backend-xxxx.onrender.com`).

Once you push to GitHub, Render will automatically redeploy. It should connect perfectly this time! Let me know if that works.
